

New! Wake From Sleep Enhancement!

Have you ever connected to your office LAN using VPN only to discover that the machine you want to access is asleep or in standby mode? This latest enhancement to SSL VPN solves the problem.

Just add remote machines to your SSL VPN preferences from a pull down menu and next time you log in each machine will be sent a special packet that will wake it from sleep.

Most modern machines have the ability to wake from a sleep state, but some older machines don't. There is a test button that will appear when you add the workstation that should be used to determine if it will work for you.
